Biofouling or biological fouling is the accumulation of microorganisms, plants, algae, or animals on wetted surfaces. Such accumulation is referred to as epibiosis when the host surface is another organism and the relationship is not parasitic.. Antifouling is the ability of specifically designed materials and coatings to remove or prevent biofouling by any number of organisms on wetted surfaces.

A superalloy, or high-performance alloy, is an alloy that exhibits several key characteristics: excellent mechanical strength, resistance to thermal creep deformation, good surface stability, and resistance to corrosion or oxidation. The crystal structure is typically face-centered cubic austenitic. Examples of such alloys are Hastelloy, Inconel, Waspaloy, Rene alloys, Incoloy, MP98T, TMS alloys ...

Solution annealing to increase the stability of methylammonium lead iodide (CH<sub>3</sub>NH<sub>3</sub>PbI<sub>3</sub>) based solar cells towards humidity by accessing cubicâ€•phase films in the solid state at room temperature is demonstrated. The cubic phase prevents the formation of perovskite monohydrate on exposure to humidity, which is a pathway of degradation in conventionally processed perovskite thin films.

Water-based coatings vs. solvent-based coatings. Coatings frequently take their name from the binder, or resin, from which they're made. Epoxies, alkyds and urethanes are all examples of resins that give a coating their name.
