a rapid evolution of MOS analog integrated circuits. Thirty years ago, CMOS technologies were fast enough to support applications only at audio frequencies. However, the continuing reduction of the minimum feature size in integrated-circuit (IC) technologies has greatly increased the maximum operating frequencies, and CMOS technologies have become fast enough for many new applications as a result.

In integrated circuits, the relentless pressure toward faster digital speed has resulted in ever-decreasing supply voltages, which are anathema to high-performance analog design. At 350nm (3.3V) there is still enough headroom for a high-performance analog design, though 5 Volts would be better.

The circuit below shows a cascade of first-order uncompensated Common-source amplifiers. It can be estimated that the time constant of the cascade stage is approximately equal to 3 times the time constant of a single stage, usually must faster than an OpAmp. So, to design high speed comparators, one should make V_{eff} of each stage large.
