A differential amplifier is a type of electronic amplifier that amplifies the difference between two input voltages but suppresses any voltage common to the two inputs. It is an analog circuit with two inputs  $v_1$  and  $v_2$  and one output in which the output is ideally proportional to the difference between the two voltages  $v_o = A(v_1 - v_2)$  where  $A$  is the gain of the amplifier.

Matrix Editions is a small publishing house founded in 2001, committed to "serious mathematics, written with the reader in mind." Our goal is to publish rigorous books that go beyond correct statements to show why statements are correct and why they are interesting.

The Journal of Pseudo-Differential Operators and Applications is a forum for high quality papers in the mathematics, applications and numerical analysis of pseudo-differential operators. Pseudo-differential operators are understood in a very broad sense embracing but not limited to harmonic analysis, functional analysis, operator theory and algebras, partial differential equations, geometry ...

Differential scanning calorimetry, or DSC, is a thermoanalytical technique in which the difference in the amount of heat required to increase the temperature of a sample and reference is measured as a function of temperature. Both the sample and reference are maintained at nearly the same temperature throughout the experiment. Generally, the temperature program for a DSC analysis is designed ...

Here is a set of notes used by Paul Dawkins to teach his Differential Equations course at Lamar University. Included are most of the standard topics in 1st and 2nd order differential equations, Laplace transforms, systems of differential equations, series solutions as well as a brief introduction to boundary value problems, Fourier series and partial differential equations.
