Ensemble Methods in Machine Learning

The idea of ensemble learning is to employ multiple learners and combine their predictions. There is no definitive taxonomy. Jain, Duin and Mao (2000) list eighteen classifier combination schemes; Witten and Frank (2000) detail four methods of combining multiple models: bagging, boosting, stacking and error-

(PDF) Ensemble methods: A review - ResearchGate

Ensemble modeling is a powerful way to improve the performance of your model. It usually pays off to apply ensemble learning over and above various models you might be building. Time and again, people have used ensemble models in competitions like Kaggle and benefited from it.

Basics of Ensemble Learning Explained in Simple English

Ensemble methods are learning algorithms that construct a set of classifiers and then classify new data points by taking a (weighted) vote of their predictions. The original ensemble method is Bayesian averaging, but more recent algorithms include error-correcting output coding, Bagging, and boosting.

Ensemble methods can be also used for improving the quality and robustness of clustering algorithms (Dimitriadou et al., 2003). Nevertheless, in this chapter we focus on classifier ensembles. In the past few years, experimental studies conducted by the machine-learning community show that combining the outputs of multiple classifiers
