

exponential growth and decay pdf

Exponential growth is exhibited when the rate of change—the change per instant or unit of time—of the value of a mathematical function is proportional to the function's current value, resulting in its value at any time being an exponential function of time, i.e., a function in which the time value is the exponent.

Exponential decay occurs in the same way when the growth rate is negative.

Exponential growth - Wikipedia

A quantity is subject to exponential decay if it decreases at a rate proportional to its current value.

Symbolically, this process can be expressed by the following differential equation, where N is the quantity and λ (lambda) is a positive rate called the exponential decay constant: $\frac{dN}{dt} = -\lambda N$. The solution to this equation (see derivation below) is: $N = N_0 e^{-\lambda t}$,

The Journal of Mathematical Analysis and Applications presents papers that treat mathematical analysis and its numerous applications. The journal emphasizes articles devoted to the mathematical treatment of questions arising in physics, chemistry, biology, and engineering, particularly those that stress analytical aspects and novel problems and their solutions.
