A finite difference is a mathematical expression of the form $f(x + b) - f(x + a)$. If a finite difference is divided by $b - a$, one gets a difference quotient. The approximation of derivatives by finite differences plays a central role in finite difference methods for the numerical solution of differential equations, especially boundary value problems.

However, Hotelling doesn't get you to economic growth with finite resources " production is still decreasing over time, and tends asymptotically to zero " it's just that there is no collapse and oil is distributed over time such that there are no gains in net present value to be achieved by shifting production forward or back in time.
