The Park Group is affiliated with the Department of Chemistry and Chemical Biology and the Department of Physics at Harvard University. The group focuses on fundamental studies of nanoscale electrical, optical, and plasmonic devices that operate based upon quantum mechanical principles as well as the development of new nano- and microelectronic tools that can interface with living cells, cell ...

An optical fiber or optical fibre is a flexible, transparent fiber made by drawing glass or plastic to a diameter slightly thicker than that of a human hair. Optical fibers are used most often as a means to transmit light between the two ends of the fiber and find wide usage in fiber-optic communications, where they permit transmission over longer distances and at higher bandwidths (data rates ...

Ellipsometry is an optical technique for investigating the dielectric properties (complex refractive index or dielectric function) of thin films. Ellipsometry measures the change of polarization upon reflection or transmission and compares it to a model. It can be used to characterize composition, roughness, thickness (depth), crystalline nature, doping concentration, electrical conductivity ...

Amazing news: Researchers in Switzerland have separated an Electron into two smaller quasi-particles "a "Spinon" and an "Orbiton," meaning they have physically separated the spin and the orbit properties of an Electron. Until now, standard physics generally accepted that an Electron was a fundamental particle " that it was not made of smaller components.
