Hydraulic fracturing (also fracking, fraccing, frac'ing, hydrofracturing or hydrofracking) is a well stimulation technique in which rock is fractured by a pressurized liquid. The process involves the high-pressure injection of 'fracking fluid' (primarily water, containing sand or other proppants suspended with the aid of thickening agents) into a wellbore to create cracks in the deep-rock ...

Mechanical Test Specimens: View PDF version: Mechanical test specimens are used to evaluate the physical characteristics of materials. Assessing the strength, ductility, and hardness of an alloy gives the engineer valuable information in determining the best materials for use in industrial applications.

Two-dimensional fracture propagation models. The Howard and Fast model was a 2D model. In the following years, other 2D models were published. With a 2D model, the engineer fixes one of the dimensions, normally the fracture height, then calculates the width and length of the fracture.

A fracture is any separation in a geologic formation, such as a joint or a fault that divides the rock into two or more pieces. A fracture will sometimes form a deep fissure or crevice in the rock. Fractures are commonly caused by stress exceeding the rock strength, causing the rock to lose cohesion along its weakest plane. Fractures can provide permeability for fluid movement, such as water ...

The course reviews the basic concepts of hydraulic fracturing and the broad applications of the technique. Fracturing technology benefits and limitations in all types of sandstone and carbonate reservoirs are explained.

This note explores the nature of rocks and rock masses as construction, foundation, or engineering materials. Topics covered include: Physical properties of intact rocks, stresses and strains, thermal, hydraulic and mechanical properties of rocks and rock masses, applications of theory of elasticity in rock mechanics, visco-elasticity, rock discontinuities, hemispherical projection methods, in ...

The first fluid pumped into a well during a fracture treatment is called the "prepad." The prepad is used to fill the casing and tubing, test the system for pressure, and break down the formation. Next, the pad fluid, which is the viscous fracturing fluid used during the treatment, is pumped. No propping agent has been added to the pad.

Fracture patterns can be mapped from the exposure of rock outcrops or man-made excavations (e.g. borehole, quarry, tunnel and roadcut). These geologically-mapped fracture networks were widely used to understand the process of fracture formation, interpret the history of tectonic stresses, and derive the statistics and scaling of fracture populations.
