Plastic is material consisting of any of a wide range of synthetic or semi-synthetic organic compounds that are malleable and so can be molded into solid objects.. Plasticity is the general property of all materials which can deform irreversibly without breaking but, in the class of moldable polymers, this occurs to such a degree that their actual name derives from this specific ability.

Polyurethane (PUR and PU) is a polymer composed of organic units joined by carbamate (urethane) links. While most polyurethanes are thermosetting polymers that do not melt when heated, thermoplastic polyurethanes are also available.. Polyurethane polymers are traditionally and most commonly formed by reacting a di- or tri poly-isocyanate with a polyol. Since polyurethanes contain two types of ...

The two main methods to produce LA are by bacterial fermentation of carbohydrates or by chemical synthesis .Bacterial fermentation is the preferred industrial process used by NatureWorks LLC and Corbion Å®, the two major producers of PLA. Chemical synthesis has many limitations, including limited production capacity, inability to produce only the desired L-LA isomer, and high manufacturing costs .
