Nuclear fusion is the only process reasonably capable of powering the sun, and one product of this fusion is invisible particles called 'neutrinos'. But why don't we observe as many solar neutrinos as theory would predict?

Alex, a lapse rate $\sim -g/C_p$ is indeed very common, but it is NOT the "equilibrium" condition. Instead it is the typical "steady-state" condition when there is a heat flow up through a gas (which there is in every atmosphere of every planet and moon in the solar system).

Mike Asks: Although the Law of Conservation of Mass can be used to explain that for a mass of smoke to exit an equal amount of mass of oxygen must enter. But in reality is the mass of smoke inside the townhouse not an artificial mass "meaning"-typically all things in life are trying to reach an equilibrium.
