Until 19th century, linear algebra was introduced through systems of linear equations and matrices. In modern mathematics, the presentation through vector spaces is generally preferred, since it is more synthetic, more general (not limited to the finite-dimensional case), and conceptually simpler, although more abstract. A vector space over a field  $F$  (often the field of the real numbers) is a ...

but his point is still correct, the linear algebra is wasted due to the way of explanation and still is. The way they teach school or university up till today and all the online courses was exactly about knowing, sizes, vectors, positive definite and determinant zero.

Linear Algebra and its Applications publishes articles that contribute new information or new insights to matrix theory and finite dimensional linear algebra in their algebraic, arithmetic, combinatorial, geometric, or numerical aspects. It also publishes articles that give significant applications of matrix theory or linear algebra to other branches of mathematics and to other sciences.

In linear algebra and functional analysis, a projection is a linear transformation  $P$  from a vector space to itself such that  $P^2 = P$ . That is, whenever  $P$  is applied twice to any value, it gives the same result as if it were applied once ( $\cdot$ ). It leaves its image unchanged. Though abstract, this definition of "projection" formalizes and generalizes the idea of graphical projection.
