In linear algebra, functional analysis, and related areas of mathematics, a norm is a function that assigns a strictly positive length or size to each vector in a vector space—except for the zero vector, which is assigned a length of zero. A seminorm, on the other hand, is allowed to assign zero length to some non-zero vectors (in addition to the zero vector).

In linear algebra, an eigenvector or characteristic vector of a linear transformation is a non-zero vector that changes by only a scalar factor when that linear transformation is applied to it. More formally, if  $T$  is a linear transformation from a vector space  $V$  over a field  $F$  into itself and  $v$  is a vector in  $V$  that is not the zero vector, then  $v$  is an eigenvector of  $T$  if  $T(v)$  is a scalar ...
