Inorganic Mechanisms II Core Module 7 Richard Douthwaite

There are two mechanisms by which inorganic complexes transfer electrons. The outer sphere mechanism and the inner sphere mechanism. The outer sphere mechanism is important because of the analogy that can be drawn between electron transfer in metal complexes and electron transfer in metalloenzymes.

2. Reaction Types for Inorganic Complexes 1. Substitution Reactions - one (or more) ligands replace another ligand in the coordination sphere of a metal e.g. $[\text{Pt}(\text{NH}_3)_4]^{2+} + \text{Cl}^- \rightarrow [\text{Pt}(\text{NH}_3)_3\text{Cl}]^+ + \text{NH}_3$ These are the most common reactions of coordination compounds. They involve substitution of one ligand in a coordination sphere for another. 2.

This series, Mechanisms of Inorganic and Organometallic Reactions, provides an ongoing critical review of the published literature concerned with the mechanisms of reactions of inorganic and organometallic compounds.

Mechanisms of Inorganic and Organometallic Reactions

Mechanisms of Inorganic and Organometallic Reactions provides an ongoing critical review of the primary literature concerned with mechanisms of inorganic and organometallic reactions. The main focus is on reactions in solution, although solid-state and gas-phase studies are included where they provide relevant mechanistic insight.
