There are several ways to prepare quantum dots, the principal ones involving colloids. Colloidal synthesis. Colloidal semiconductor nanocrystals are synthesized from solutions, much like traditional chemical processes. The main difference is the product neither precipitates as a bulk solid nor remains dissolved. Heating the solution at high temperature, the precursors decompose forming monomers ...

Nanotechnology and Advanced Spectroscopy Team

To make interacting photons, the team shone a weak laser through a cloud of cold rubidium atoms. Rather than emerging from this cloud separately, the photons within the laser merged bound in groups of three.

I found my thoughts returning to a troubling dream the night before, the meaning of which remained obscure: I had been clambering with difficulty over a rocky hill near my childhood home, and found myself moving toward a large white nightshirt hung ominously from the electrical wires, as some kind of warning or portent.
