Seismic analysis is a subset of structural analysis and is the calculation of the response of a building (or nonbuilding) structure to earthquakes. It is part of the process of structural design, earthquake engineering or structural assessment and retrofit (see structural engineering) in regions where earthquakes are prevalent.. As seen in the figure, a building has the potential to 'wave' back ...

These maps were scanned from the IRC 2012 building code. It identifies the areas of seismic risk as determined by the ICC and can help you determine if seismic risk is an issue for your building project.

Seismic loading is one of the basic concepts of earthquake engineering which means application of an earthquake-generated agitation to a structure. It happens at contact surfaces of a structure either with the ground, or with adjacent structures, or with gravity waves from tsunamis.. Seismic loading depends, primarily, on: Anticipated earthquake's parameters at the site - known as seismic hazard

It is vitally important to consider the effect non-structural elements (façades and partitions) have on the behaviour of a building exposed to seismic action, especially when open floors are present or a floor contains partitions and façades that are less rigid than those on other floors.. There are design codes that oblige project designers to contemplate the absence or reduction of the ...
