In statistics, a generalized additive model (GAM) is a generalized linear model in which the linear predictor depends linearly on unknown smooth functions of some predictor variables, and interest focuses on inference about these smooth functions. GAMs were originally developed by Trevor Hastie and Robert Tibshirani to blend properties of generalized linear models with additive models.

In probability theory and statistics, a Gaussian process is a stochastic process (a collection of random variables indexed by time or space), such that every finite collection of those random variables has a multivariate normal distribution, i.e. every finite linear combination of them is normally distributed. The distribution of a Gaussian process is the joint distribution of all those ...

Gaussian Processes and Kernel Methods Gaussian processes are non-parametric distributions useful for doing Bayesian inference and learning on unknown functions. They can be used for non-linear regression, time-series modelling, classification, and many other problems.

Story. Doing Data Science Exercises Without Data Cleaning and Coding. So as a data scientists/data

journalist/information designer, who is about to teach university courses, I asked is it possible to teach and introductory level class that does not require first learning a lot about data cleaning and coding?

I think retraction of papers that report uncorrected statistics is a bit much to ask for; after all, most of the results that were published in the days before rigid statistical corrections were common have turned out to replicate, and indeed large-scale meta-analyses have shown a good degree of consistency, at least in the sets of regions that activate for broad task contrasts.
