This is a very short but interesting book about statistical methods in physics, particularly in high energy physics. The book is present with a modern perspective; explain a little bit some very recent techniques and discussions about statistical techniques especially in the field of estimating interval coverage.

Statistics is a branch of mathematics dealing with data collection, organization, analysis, interpretation and presentation. In applying statistics to, for example, a scientific, industrial, or social problem, it is conventional to begin with a statistical population or a statistical model process to be studied. Populations can be diverse topics such as "all people living in a country" or ...

Data analysis is a process of inspecting, cleansing, transforming, and modeling data with the goal of discovering useful information, informing conclusions, and supporting decision-making. Data analysis has multiple facets and approaches, encompassing diverse techniques under a variety of names, while being used in different business, science, and social science domains.

Materials and methods. Imputation methods based on statistical techniques, e.g., mean, hot-deck and multiple imputation, and machine learning techniques, e.g., multi-layer perceptron (MLP), self-organisation maps (SOM) and k-nearest neighbour (KNN), were applied to data collected through the "El Álamo" project, and the results were then compared to those obtained from the listwise ...

There are numerous ways to describe and present the variation that is inherent to most data sets. Range (defined as the largest value minus the smallest) is one common measure and has the advantage of being simple and intuitive. Range, however, can be misleading because of the presence of outliers, and it tends to be larger for larger sample sizes even without unusual data values.

Measures of dispersion and symmetry. The next group of statistics describes how the data are dispersed or spread out from the "center." That is, the degree of data dispersion advises us how well our chosen measure of central tendency does indeed represent the data and, by extension, how much we can trust it to describe the underlying population.
